- Using this action, we can define a quiver Q_{S_n} :
 - One vertex for each orbit of the vertices of Q.

- We have a surjection $\varphi: k\mathcal{Q} \to k\mathcal{F}$.
- Lift the action of S_n to $k\mathcal{Q}$ using φ .
- The action maps paths to signed paths, preserving length.

Sac

- Using this action, we can define a quiver \mathcal{Q}_{S_n} :
 - One vertex for each orbit of the vertices of Q.
 - One arrow $[X] \to [Y]$ iff $\sum \omega(X \to Y) \neq 0$.

▶ Theorem [Garsia-Reutenauer]. The quiver of $\mathcal{D}(S_n)$ has a vertex for each partition of n, and $q \rightarrow p$ iff q is obtained from p by adding two distinct integers of p.

▶ Theorem [Garsia-Reutenauer]. The quiver of $\mathcal{D}(S_n)$ has a vertex for each partition of n, and $q \rightarrow p$ iff q is obtained from p by adding two distinct integers of p.

▶ The kernel of $kQ_{S_n} \rightarrow D(S_n)$ is not well understood.

Idempotents in $\mathcal{D}(S_n)$.

Idempotents in $\mathcal{D}(S_n)$.

► Much interest exists in constructing idempotents in D(S_n), for applications and to understand the structure of D(S_n). Several families of idempotents have been constructed (Garsia-Reutenauer, Bergeron-Bergeron-Howlett-Taylor, Diaconis-Bayer).

Connections with the Free Lie Algebra

Let Lie_n denote the 1ⁿ homogeneous component of the free Lie algebra on n elements. Then, as S_n-modules, Lie_n is isomorphic to the vector space spanned by the maximal paths in kQ modulo the relations.

Connections with the Free Lie Algebra

- Let Lie_n denote the 1ⁿ homogeneous component of the free Lie algebra on n elements. Then, as S_n-modules, Lie_n is isomorphic to the vector space spanned by the maximal paths in kQ modulo the relations.
- ▶ This connection is via poset cohomology. The cohomology of the lattice of set partitions of [n] is an S_n-module. Tensoring with the sign representation gives both of the above.
▶ kF is a Koszul algebra. Its Koszul dual is the incidence algebra of the intersection lattice of A. What does this duality between the modules give us?

〈ロ〉 〈聞〉 〈注〉 〈注〉 二注

 $\mathfrak{I}_{\mathcal{A}}$

- ▶ kF is a Koszul algebra. Its Koszul dual is the incidence algebra of the intersection lattice of A. What does this duality between the modules give us?
- Determine the quiver of the descent algebra for other finite Coxeter groups. Describe the quiver relations. (Even for S_n).
